

## 296695 - Ruling on using a contraceptive implant

---

### the question

One of the modern means of contraception that are used nowadays is implantation of an electronic device in the lower forearm. This device is a thin flexible tube the width of a matchstick. The way in which it prevents pregnancy is by secreting a hormone that has several functions, the most significant of which is that it increases the thickness of mucus around the cervix of the womb, thereby preventing sperm from reaching and fertilising the egg. What is the ruling on using it, noting that it is a very effective method of contraception, by Allah's leave, and its effect on the woman's health is minimal in most cases, according to the opinion of most doctors? I hope that you will answer. Thank you and may Allah reward you.

### Detailed answer

Praise be to Allah.

There is nothing wrong with using this method of contraception, which is based on placing a device into the lower forearm which secretes a hormone that increases the thickness of mucus around the cervix of the womb, thereby preventing sperm from reaching and fertilising the egg.

On the website Majallat Hayya it says: We regard this device as being 99% effective in preventing pregnancy, if it is used and implanted correctly. The way in which this device works to prevent pregnancy after being implanted is by releasing the hormone progestogen, which is an alternative to the progesterone that naturally occurs in the blood. It suppresses the monthly production of eggs and increases the thickness of mucus around the cervix of the womb, and prevents sperm from reaching the egg.

The second way in which this hormone works is by weakening the lining of the womb, making it unable to support the fertilised egg. End quote.

This method is not free of side-effects, such as disruption of the menstrual cycle. Some women may suffer from intermittent bleeding that goes on for a long time.

If a woman needs to use contraception for a while, she should consult specialists who are trustworthy in terms of their knowledge and experience, and who understand her situation and her general state of health.

After that, she should look into the effects of this implant; if the harm it may cause is less than the benefit of using it, then there is nothing wrong with using it in that case.
